

SYLLABUS :-

Credits: 5 L-T-P: 2-0-4 Prerequisite: Architectural Design I Course

Overview: This is an intermediate level of design course where students need to apply their theoretical knowledge of climatic data, basic structures, materials, and forms. Students are assigned specific types of buildings about which they are very familiar as a user. Students are encouraged to think about their local (community level) issues and how to minimize this through architectural design. For example: In the wake of pandemics such as Covid-19, there is a need to rethink the architectural design of indoor and outdoor spaces where members of a community tend to meet for group events, social care, public information, and other purposes. Students are encouraged to think about how this pandemic will affect the future design and operation of the community or school spaces in India for an uninterrupted operation during and post Covid-19 like situations. For developing the space apart from the design brief, students are encouraged to refer to literature and do case study - both in real life and from books or the internet. **Learning Objectives:** 1. Demonstrate an intermediate level of competence in architectural design followed from the previous semesters. 2. Learning of current local/national issues related to building or public spaces design and operation. 3. Combine the knowledge gathered from theoretical subjects such as climatology, materials, structures etc. in design process. 4. Critically analyze and respond appropriately to a compound brief. 5. Employ various methods of rendering, delineation and presentation. 6. Judge students' ability through individual and group project with longer and short time schedule. **Course Curriculum:** Module 1 : Design theory and application, Design emphasizing forms. Module 2 : Literature study of current local/national issues related to buildings or public spaces. Module 3 : Understanding of design and related issues through field visits and case studies. Module 4 : Development of a methodology to minimize design issues. Module 5 : Application of the theoretical knowledge of climatic data, social and structural systems, building materials, etc. to address design problems. **Suggested projects:** Community centre, Students' dormitory, Secondary school etc. **Reading List:** 1. Bureau of Indian Standards, The National Building Code of India (NBC), New Delhi, 2005. 2. Watson, D. and Crosbie, M.J., Time Saver Standards for Architectural Design: Technical Data for Professional Practice, McGraw-Hill Professional, New York, (8th Ed.), 2004.
